NIGMS Human Genetic Cell Repository

Human induced Pluripotent Stem Cell (iPSC) Line: GM29090\*B

Diagnosis	Apparently Healthy
Parental cell line mutation	
Parental cell type, cell line ID	Fibroblast, GM23249
Sex	Male
Reprogramming method	Sendai viral vectors containing OCT4, SOX2, KLF4, and CMYC
Passage number at freeze	P14
Culture media	mTeSR1™
Feeder or Matrix substrate	Matrigel®
Recommended passage method and split ratio	Versene, 1:6 every 5 days
iPSC line establishment publication(s)	

The following testing specifications have been met for this product lot:

Test Description	Test Method	Test Specification	Result
Post-Thaw Cell Viability	Colony doubling Colony formation and diameter doubling within 5 days		Pass
Sterility	Growth on agar and broth Negative		Pass
Mycoplasma	qRT-PCR	Negative	Pass
Alkaline Phosphatase Staining	Cell staining	>80% cells with positive staining	Pass
Identity Match	STR (THO-1, D22S417, D10S526, vWA31, D5S592, and FES/FPS)	Match parental cell line	
Genomic Integration of Episomal Plasmid	Genomic PCR using plasmid specific primers and endogenous FBXO1 control	No plasmid specific sequence amplified using 100 ng gDNA template	
Detection of Sendai Virus Genome and Transgene	qRT-PCR using SEV specific primers	No detection of SEV genome or transgenes	
Surface Antigen Expression of Stem Cell Markers	Immunostaining and flow cytometric detection	on >80% expression of SSEA4	
Differentiation Potential	Embryoid body (EB) formation and gene expression	rmation and gene Minimum of 1 gene per germ layer expressed 2 fold or higher	
Cytogenomics	G-banding	46, XY[20] Pa

## **Post-Thaw Cell Viability**

One distribution lot vial of the cell line was thawed and placed in culture. Cultures were observed daily. Colonies were photographed upon first appearance, then 2 days later. Colonies must double in diameter within 5 days. The area for 5 colonies was measured using image analysis software. The average area is reported here.

Day	Average area (µm <sup>2</sup> )	
1	16,326	
3	192,952	

Colony area increased by 12 fold.

Figure 1A. Colonies post thaw (Day 1)

Figure 1B. Colonies 2 days after first observation (Day 3)

#### **Alkaline Phosphatase Staining**

Cells were stained using the StemTAG<sup>™</sup> Alkaline Phosphatase Staining Kit from CellBiolabs, Inc.

Figure 2. iPSC colonies showing alkaline phosphatase activity

### Surface Antigen Expression of Stem Cell Markers

Undifferentiated cells are stained for stage specific embryonic antigen 4 (SSEA4) which is expressed on the surface of undifferentiated human pluripotent stem cells. Cells were analyzed using the MACSQuant Flow Cytometer by Miltyeni Biotec. More than 80% of cells should stain with antibodies specific for SSEA4.

GM29090\_B\_SSEA4\_2023-10-20.0001\Live cells\Single Cells

**Figure 3.** Representative histogram of SSEA4 positive population showing an overlay of isotype stained control (red) and SSEA4 positive population (blue)

#### **Differentiation Potential**

Cells are differentiated by embryoid body (EB) formation to assess pluripotency. RNA is extracted and gene expression is measured by quantitative RT-PCR. Ct values are adjusted to the endogenous housekeeping gene GAPDH. Relative gene expression is shown as the fold difference in expression compared to undifferentiated cells. Expression of at least one gene per germ layer should increase by 2 fold or higher.

Gene	Fold change	Gene	Fold change	Gene	Fold change	Gene	Fold change
OCT4	0	PAX6	0	Т	17	AFP	1409530
SOX2	0	NES	0	RUNX1	40	SOX17	20
NANOG	0	TP63	314	DES	24	FOXA2	64
GDF3	0	KRT14	16	PECAM1	239	SOX7	12
REXO1	1	NOG	19	TAL1	19		

Figure 4. Fold change in expression of pluripotency genes and tri-lineage specific genes

Note: Negative values are set as 0. Calculations are performed using the  $2^{-\Delta\Delta CT}$  method. (*Livak KJ*, Schmittgen TD. Methods. 2001 Dec;25(4):402-8.PMID:11846609)
